2. Citations and explanations:

The claimed invention

The claimed invention relates to a method and a system for routing a message or a set of messages or a session from a first equipment connected or registered to a first network, to a second equipment connected or registered to a second network.

The following document were cited in the International Search Report:

D1: WO 99 11 087 A2 D2: WO 02 43 405 A1 D3: WO 00 79 825 A1

D1 relates to a method and a system for processing calls for communication equipment with a subscriber number ported from a first operator to a second operator. D1 describes on page 2 lines 4-23 that each communication network forms a database of ported (routed) numbers. The database is accessible from at least one gateway exchange and the subscriber numbers ported one operator to another are stored together information about the network to which the subscriber numbers belong. Upon an incoming call (setup request), the called subscriber number is compared with the subscriber numbers in database: and on the basis of the result comparison, routing information for the further processing of the call is composed. This implies that when checking the database for ported subscriber number, if the call is to be routed to another network, the first type of address is transformable/translatable to a second type of Consequently, the claimed invention as in claims 1 and 23 is not novel.

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

D1 does not specify that a second database is used to derive the address of a contact point of the second network in the first network. However, that is considered an obvious measure to a person skilled in the art.

It is also considered obvious that also other requirements may be checked, apart from the translation between address types.

Consequently the claimed invention as in claims 2-5 and 24-28 is considered to lack an inventive step.

D1 does not state that a Serving Call State Control Function (S-CSCF) performs the requirement checking step. However, a person skilled in the art would most definitely realise that an S-CSCF would be a suitable entity to be in charge of the requirement checking step. It is also described in D2 that a CSCF is in charge of handling calls for a roamed subscriber; and as such, the CSCF is in charge of the requirement checking step. Consequently, the claimed invention as in claim 10 is considered to lack an inventive step.

D3 is considered to merely disclose the state of the art and is not commented on further.
